Key Lock

Fichet-Bauche key locks are developed from the principle of pump locking. This involves the simultaneous lowering and raising of a series of levers in correspondence with a precise reading of the key when introduced—thus making picking much more difficult. Both principle and exclusive lock designs are patented.

PERFORMANCE AND SECURITY

- ✦ A2P-certified high security lock as per EN1300
- ✦ Each lock model offers 10^7 cutting options, i.e. 10 million different locks and keys. Fitting MxB locks on your safe will deliver optimum protection for your valuables.

MxB/A

Designed to equip standard risk safes and security cabinets, this lock is Grade-A certified as per EN 1300 by both A2P and VdS.

MxB/B

Most often protecting Grade I to Grade III safes in the Millium and Carena ranges, this lock is Grade-B certified as per EN 1300 by both A2P and VdS.

MxB/C

Designed for high risk safes and vault doors, this C version is intended for the InviKtus and Optura ranges.

- ✦ Captured key principle: once introduced for opening, keys cannot be taken out without triggering permanent locking
- ✦ Reinforced protection on MxB/C locks:
 - Protective caps on pump heads will self-destruct in the event of a drilling attack on the lock
 - Integrated relockers will be triggered by any forceful action
- ✦ Controlled reproduction of keys (no reproduction map supplied)
